

Why Liftronic® is better than a hoist

Features	HOIST	Liftronic®
UP / DOWN MOVE SPEED	10 meters/minute	4 times higher: 42 meters/minute
Quick and precise load positioning	Using one hand only makes all operations more difficult, slow and less precise	The operator can handle the load either by means of the sensitive handle, or directly with his hands on the load; movements are easy and smooth as in manual handling, but with the power of a machine; load moving and positioning is quick and precise, and productivity improved.
User friendly	With the hoist the operator has got only one hand free, as one is required for keeping the UP/DOWN button pressed.	The operator can use both hands as there are no buttons to press and keep pressed.
Use Versatility	A hoist can be equipped only with standard end effectors .	Thanks to the quick coupling device it is possible to replace quickly and easily the end effectors , thus making it possible handling loads with different sizes, shapes and weights with a very short stop time. Scaglia Indeva is a specialist in designing custom made end effectors .
Purchase and operation costs	Considering the advantages a Liftronic provides compared to a hoist, a Liftronic has surely got a higher performance/price ratio , whilst the operation costs are even less.
